# ASSIGNMENT 4

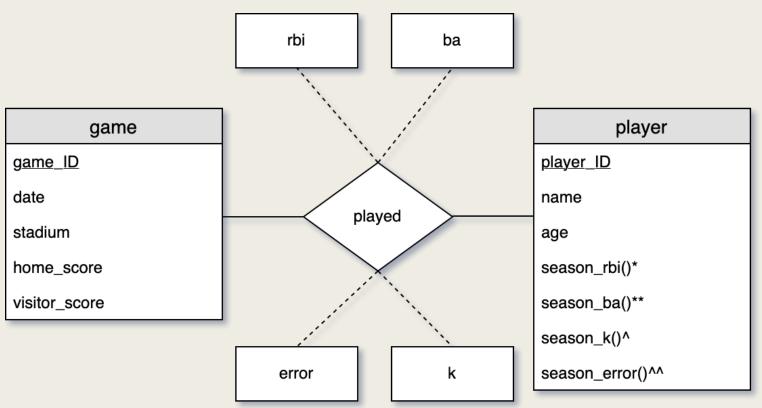

Kira Lowe

## 1. Weak vs. Strong Entity Sets

- A weak entity set depends on another entity set, called an identifying entity set
  - Cannot be identified by attributes alone
  - A good identifying feature is that they often do not have their own primary keys
  - Example:
    - Rooms exist within buildings; attributes are not necessarily unique even within each building

### 2. Baseball E-R Diagram

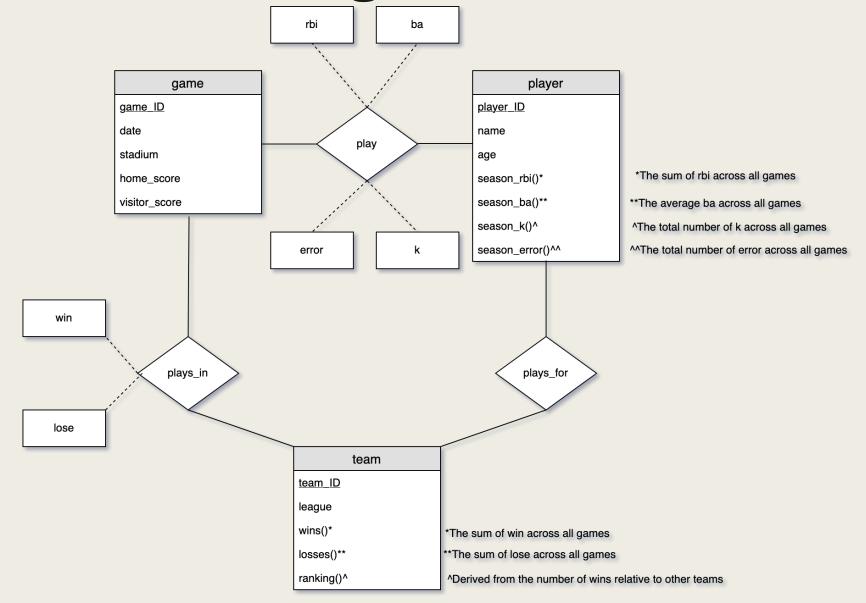

\*The sum of rbi across all games

\*\*The average ba across all games

^The total number of k across all games

^^The total number of error across all games

2. Baseball E-R Diagram

#### 3a. SQL Exercise

- i. Including a natural join to section would not change the result because course\_id is a primary key in both *takes* and *course*, bypassing the need for section
- ii. This is confirmed through testing:

```
1 select course_id, semester, year, sec_id, avg (tot_cred)
2 from takes natural join student
3 where year = 2017
4 group by course_id, semester, year, sec_id
5 having count (ID) >= 2;
```

| course_id | semester | year | sec_id | avg | (tot_cred) |
|-----------|----------|------|--------|-----|------------|
| CS-101    | Fall     | 2017 | 1      | 65  |            |
| CS-190    | Spring   | 2017 | 2      | 43  |            |
| CS-347    | Fall     | 2017 | 1      | 67  |            |

| 2 | <pre>select course_id, semester, year, sec_id, avg (tot_cred) from takes natural join student natural join section where year = 2017</pre> |
|---|--|
|   | <pre>group by course_id, semester, year, sec_id having count (ID) &gt;= 2;</pre>   |

| course_id | semester | year | sec_id | avg | (tot_cred) |
|-----------|----------|------|--------|-----|------------|
| CS-101    | Fall     | 2017 | 1      | 65  |            |
| CS-190    | Spring   | 2017 | 2      | 43  |            |
| CS-347    | Fall     | 2017 | 1      | 67  |            |

### 3b. SQL Exercise

Write an SQL query using the university schema to find the ID of each student who has never taken a course at the university

```
1 SELECT DISTINCT s.id, s.name
2 FROM student AS s
3 LEFT OUTER JOIN takes AS t
4 ON s.id = t.id
5 WHERE t.id IS NULL
```

```
1 SELECT s.id, s.name FROM student s
2 WHERE s.id NOT IN (SELECT id FROM takes)
```

```
ID name
70557 Snow
```
